ABSTRACT

A system, method and apparatus is disclosed for providing real-time access to a network organized repository of data. The system includes a computing system including one or more computers having one or more processors for executing a first set of program instructions and a first memory for storing the first set of program instructions; and a server, in communication with the computing system, the server having one or more processors for executing a second set of program instructions and a second memory for storing the second set of program instructions, the server being configured to support one or more users and to provide shared access to one or more telecommunication computer software programs, the server being coupled to one or more resources for managing, communicating and the storing data and the computer software programs. The method provides real-time access to the network organized repository of data by providing access to the telecommunication computer software programs to a computer and communicating to the server with the computing system and providing the user of the computer with real-time access to the data and the telecommunication programs and any changes made thereto. The apparatus provides a computer readable medium having a set of computer instructions encoded thereon.
